Introduction

- Due to Covid, 2020 NCAA tournament did not happen.
- Question: Are there certain regular season variables that are better predictors for postseason outcomes?
- Goal: Use existing data/trends from other years and regular season data from 2020 to come up with potential methods of prediction and postseason outcomes.

- College Basketball Dataset folder found on Kaggle. Dataset "cbb.csv" has regular and postseason statistics from years 2013-2021. Excludes 2020 season due to lack of postseason statistics.
- Folder included datasets for each individual year, with 2020 ("cbb20.csv") having regular season stats only.
- Variables of final dataset: YEAR, TEAM, CONF, G, W, BARTHAG, POSTSEASON, SEASON_FINAL.

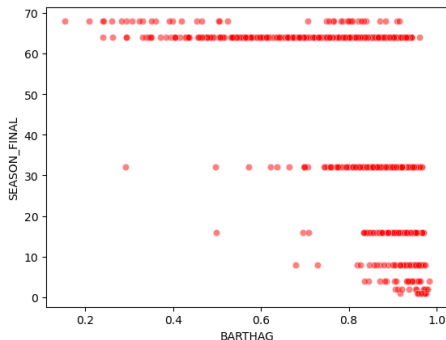

- Created numerically coded column, SEASON_FINAL, derived from POSTSEASON (string data type) for cbb.csv dataframe. (Ex: "Champions" = 1, "2ND" = 2, "F4" = 4)
- Initialized variables POSTSEASON and SEASON_FINAL as NaN for cbb20.csv dataframe. This is what we will fill in through our prediction methods.

Exploratory Data Analysis

- Determine what variables are most correlated with POSTSEASON outcomes.
- Used Spearman correlation since it is more appropriate for measurements taken from ordinal scales.

Exploratory Data Analysis

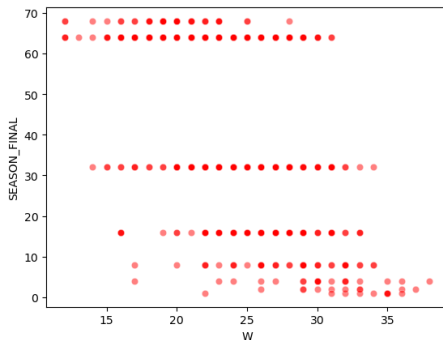

- BARTHAG vs SEASON_FINAL
- BARTHAG = Power Rating (Chance of beating an average Division 1 team)

Corr: -0.6461273899341722

Exploratory Data Analysis

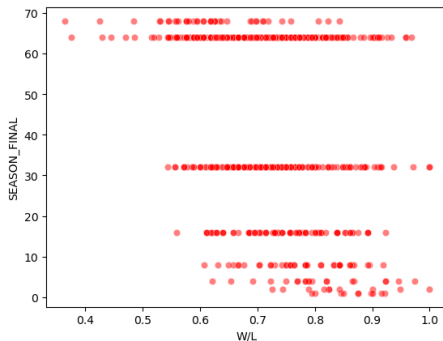

- W vs SEASON_FINAL
- W = Number of games won

Corr: -0.5125436890870254

Exploratory Data Analysis

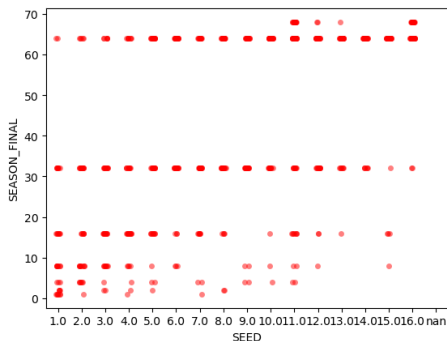

- W/L vs SEASON_FINAL
- W/L = Win-Loss Ratio

Corr: -0.3532346489556209

Exploratory Data Analysis

- SEED vs SEASON_FINAL
- SEED = Seed in the NCAA March Madness Tournament

Corr: 0.6065146756151623

- Package contains a function that takes a season and method of prediction, then produces simulated results of an NCAA tournament.
- Compare predicted results to actual results.
- Create a prediction for 2020 NCAA postseason tournament.
- Since seeding was not determined for 2020 postseason, variable RK will be used as a predictor.

- Method: BARTHAG (Power Rating)

```
Round 1:
Baylor vs Texas Southern -> Winner: Baylor
Cincinnati vs VCU -> Winner: Cincinnati
Illinois vs East Tennessee St. -> Winner: Illinois
Auburn vs College of Charleston -> Winner: Auburn
Iowa vs Mississippi St. -> Winner: Iowa
Seton Hall vs Bowling Green -> Winner: Seton Hall
Ohio St. vs Northern Iowa -> Winner: Ohio St.
Louisville vs Murray St. -> Winner: Louisville

Round 2:
Baylor vs Cincinnati -> Winner: Baylor
Illinois vs Auburn -> Winner: Illinois
Iowa vs Seton Hall -> Winner: Seton Hall
Ohio St. vs Louisville -> Winner: Ohio St.

Round 3:
Baylor vs Illinois -> Winner: Baylor
Seton Hall vs Ohio St. -> Winner: Ohio St.

Round 4:
Baylor vs Ohio St. -> Winner: Baylor

Baylor advances to the Final Four!

Conclusion

- While there is a lot of randomness and uncertainty to account for in the NCAA tournament, there are variables that can accurately predict the outcomes.
- Among the variables observed, power rating was the strongest method of prediction.
- Potential to apply package to other variables as well.
- Aside from our own observations, we could apply further analyses to evaluate the accuracy of our predictors.
- Potential to use same methods to make predictions for future seasons.
